Abstract

Derivatives of 3,4-ethylenedithiothiophene (EDTT) are reported starting from tetrabromothiophene. Selective 2,5-dilithiation followed by reaction with a range of aldehydes gives diols as mixtures of diastereomers. Only the 2 and 5 positions in thiophene react leaving the 3,4-bromides for further elaboration. The diols are oxidised to their corresponding diketones using activated MnO\textsubscript{2}. Reaction with 1,2-ethanedithiol, by addition-elimination, provides access to novel monomers for the preparation of conjugated copolymers of 3,4-ethylenedithiothiophene (EDTT). A range of these monomers can be attained by applying the synthesis of a series of ketones applicable to further synthesis of \(\pi\)-extended thiophene-based organic semiconductors. Finally, this new route was compared to 3,4-ethylenedioxythiophene (EDOT) dialdehyde derivatives synthesised by an alternative to literature chemistry.

Keywords: Addition-elimination reaction; 3,4-Ethylenedithiothiophene; 1,2-Ethanedithiol; Organic semiconductors; EDTT

1 Introduction

From their initial mainstream uptake in the early 1980s oligothiophenes have risen to become one of the most privileged structures in the organic semi-conducting materials area.\textsuperscript{1, 2} By appropriate choice of thiophene substituents and microstructure (e.g. degree of oligomerisation, connectivity, use of additives, etc.) the resultant materials’ (opto)electrical properties can be modulated with a high degree of precision. This ability to tune thiophene based materials for a specific application has led to their widespread use in organic photovoltaics (OPV),\textsuperscript{3} organic field effect transistors (OFET),\textsuperscript{4} sensors\textsuperscript{5} and particularly in electrochromic/electroluminescent (OLED)\textsuperscript{6} applications. Such ‘modular-materials’ approaches have created an insatiable appetite for new thiophene sub-units from materials chemists for their inclusion into oligo(poly)thiophene structures as evidenced by the thousands of papers that have appeared in this area in the last 10 years. In particular, derivatives of 3,4-ethylenedioxythiophene (EDOT)\textsuperscript{1} have proved popular targets as this monomer is easily polymerised to PEDOT-based polymers\textsuperscript{3} whose formulation with polymer supported sulfonates (PEDOT-PSS) now forms the backbone of many transparent electrode technologies. Recently, new thermoelectric (TE) applications for PEDOT-based materials have emerged,\textsuperscript{8} potentially allowing direct conversion of waste heat into electrical power. For optimal TE devices the use of bulk, rather than thin film, configurations would be preferred (to maximise power-from-heat recovery). Although the low band gap of PEDOT-PSS (1.6 eV) favours high electrical conductivity\textsuperscript{9} (vital for TE applications) the physical properties of current PEDOT-PSS co-polymers (solubility, mp) are less favourable for fabrication of bulk (mm) rather than thin film (\(~\)100 nm) devices. We considered the possibility that derivatives of the sulfur analogue of EDOT, that is EDTT\textsuperscript{2}, might prove of utility in seeking more processible entities. Both EDTT itself and PEDTT are known versatile components in organic materials chemistry.\textsuperscript{10} Although the band gap of PEDTT\textsuperscript{4} is greater (2.2 eV) than PEDOT, building in functionality to allow the creation
of vinyligous linkages at the 2,5-positions of EDTT 2 should allow band gap reduction, as similar synergies have been noted in related structures.\textsuperscript{11} The positioning of suitable groups to promote solubility and processability of bulk samples is also desirable. Consequently, two main points are investigated in this paper. Firstly, the synthesis of new polymer precursors based on EDTT 2 that might have lower band gap potentials (essential for organic materials applications) even if these are based on PEDTT-like structures. Secondly, the potential structure of the new polymers should allow for the improved solubility characteristics required for many applications. Two general strategies are employed here in to target monomers for new polymers having small HOMO–LUMO energy differences and good solubility in the different solvents. The first involves increasing the conjugation of polymers by inserting an alkenyl unit (C=C) into the structure of the polymers, to attain a lower band gap. The second strategy involves strategic placement of alkyl groups whereby the side chain will increase the polymer solubility and thus improve its processability (see Scheme 1).

Scheme 1. The structures of EDOT 1 and EDTT 2 and their derived polymers PEDOT 3 and PEDTT 4.

2 Results and discussion
2.1 Synthetic routes to derivatives of EDTT
Our initial study focused on methods to quickly and reliably attain 2,5-derivatives of 3,4-ethylenedithiothiophene (EDTT) 2 starting from the readily available crystalline tetrabromothiophene 5 (Scheme 2).

Scheme 2. Synthetic route to ketothiophenes. Reagents and conditions: (i) THF/nBuLi, RCHO, −78 to −20 °C, 3 h; (ii), MnO\textsubscript{2} (10 equiv.), CH\textsubscript{2}Cl\textsubscript{2}, 40 °C, 16 h; (iii) 1,2-ethanedithiol (2.2 equiv.), DMF, Na\textsubscript{2}CO\textsubscript{3}, 16 h, r.t.

Tetrabromothiophene 5 is easily prepared on large scales by bromination of thiophene in 73% yield, the HBr by-product is conveniently quenched by collecting the off-gas into a suitable water trap. The activated 2,5 positions of 5 are cleanly exchanged with nBuLi at −78 °C. While rearrangements (the so called “halogen dance”\textsuperscript{12}) can take place at higher temperatures, reactive electrophiles are expected to intercept the dilithiated intermediate cleanly. Relatively few investigations have employed this strategy.
but examples with: chlorotrimethylsilane, a limited number of aldehydes and acyl chlorides are known. However, the reported yields can be poor in such procedures. From a practical perspective, addition of the aldehyde at −78 °C followed by warming to −20 °C affords the maximum yield of 6a-e (40–82%) by minimising organolithium rearrangement. Compounds 6a-e are attained as a diastereomeric mixture but the syn and anti diastereomers could be separated by careful column chromatography. Each of the diastereomeric compounds 6a-e could be converted into the corresponding ketones 7a-e using activated MnO₂, in refluxing dichloromethane. Simple overnight reaction is required to attain complete conversion. Ketones 8 are easily isolated by column chromatography as they appear as bright yellow bands. The resulting micro-crystalline yellow solids show spectra in accord with the proposed formulation. The presence of two keto functions allows potentially many condensation polymers to be accessed related, in part, to EDTT 2 and PEDTT 4. For comparison, the closest literature method for the synthesis of EDTT 2 we could identify is shown in Scheme 3. This approach requires two steps from 9 to add the bis-thioether in 86% overall yield. In our approach (Scheme 2), compounds 8a-c require only one step to install the same thioether. By the reaction of 1,2-ethanedithiol with compounds 7a-c (in DMF and over 2 days in the presence of Na₂CO₃) more modest yields of 71, 50 and 45% are attained for 8a-c respectively. For further comparison, the parent 2, and its S,O-analogue, can be also prepared from 9 by the chemistry of Roncali.

![Scheme 3](image)

**Scheme 3.** One comparative route for EDTT 2.

### 2.2 Synthetic routes to derivatives of EDOT

In the last few years 3,4-ethylenedioxythiophene (EDOT) 1 and its derivatives have become very important commercial compounds for the preparation of new organic materials. However, most commercial routes to EDOT use S(CH₂CO₂Me)₂ and rely on late stage (wasteful) decarboxylation of the ester units. We wondered if a nitrile group was used instead if this could provide access to 2,5-disubstituted aldehydes closely related to our diketo-EDTT species 8. This new route to derivatives of EDOT has been investigated as shown in Scheme 4.

![Scheme 4](image)

**Scheme 4.** Synthetic route for the derivatives of EDOT
The intermediate 13 is prepared in two steps, the first uses the ultra-cheap starting material Na2S·9H2O for alkylation with chloroacetonitrile 11 in DME to yield compound 12 near quantitatively and in excellent purity which allows its use without purification. Subsequent reaction of 12 and diethyl oxalate prepares the potassium salt 13, which is also used directly without further purification, to access the dinitrile 14 in modest yield. However, 14 is easily isolated analytically pure after a simple filtration through a silica plug. Finally, 14 was converted to the corresponding aldehyde 15 by its treatment with DIBAL-H at 0 °C in anhydrous toluene. Compound 15 is already recognised as an important intermediate in the synthesis of thiophene-based semiconductor polymers.19,20

3 Conclusions
We have successfully found a new route to homologs of 3,4-ethylenedithiothiophene (EDTT) 2 having ketone functionalities at the 2,5-positions. From tetrabromothiophene 5, monomers 8a-c were obtained in three steps. In addition, the monomers 8a-c are attractive species for the future synthesis of many thiophene-based semiconductor polymers. Additionally, we have reported a new route for the synthesis of the 2,5-diformyl derivative of 3,4-ethylenedioxythiophene (EDOT), the key intermediate 14 is obtained using ultra-cheap Na2S·9H2O in just three steps. Finally, nitrile to formyl conversion proceeds cleanly in near quantitative yield.

4 Experimental
General. All reagents and solvents were purchased from Sigma-Aldrich and were used as supplied unless otherwise stated. Tetrahydrofuran was freshly distilled under argon from sodium/benzophenone. Aldehydes were distilled before use. Evaporation of the solvents was completed by rotary evaporation under reduced pressure. All temperatures refer to those of the cooling and heating baths used. Cooling of the reactions was achieved using a Haake DC50-K75 refrigerated circulator. Thin layer chromatography was performed on foil-backed plates plated with Merck Silica gel 60 F254. The plates were visualised using ultraviolet light and basic aqueous KMnO4. Liquid chromatography was carried out using flash column with specific solvent systems. All proton spectra were referenced to CDCl3 (δ = 7.27 ppm) or acetone-d6 (δ = 2.05 ppm) as an internal standard. All 13C NMR samples were proton-decoupled and referenced to CDCl3 (δ = 77.0 ppm), acetone-d6 (δ = 29.9 ppm) or DMSO-d6 (δ = 39.5 ppm). Coupling constants (J) are quoted in Hertz. Infrared spectra were recorded with a Varian FTS-7000 FT-IR spectrometer using (ATR) operating at room temperature. Mass spectrometry was performed using a Bruker MicroTOF or VG Micromass AutoSpec spectrometers using electrospray (ESI), electron impact (EI) ionization modes; theoretical HRMS molecular weights were determined by these instrument’s software. The starting materials tetrabromothiophene 5, 2,2'-thiodiacetonitrile 12 and activated MnO2 were prepared by modifications of literature procedures but are described here for clarity. Activated MnO2 was prepared by a literature method.21

4.1 Tetrabromothiophene (5)
Compound 5 was prepared by modification of a literature methods.22 Thiophene (10.6 g, 0.127 mol) dissolved in chloroform (8 mL) was treated with a solution of bromine (24 mL, 0.46 mol) in chloroform (8 mL) that was added dropwise over 50 min at 0 °C. The resulting dark mixture was stirred overnight at room temperature, then additional bromine (9.0 mL, 0.17 mol) was then added and the mixture refluxed (70 °C, 57 h). After the reaction had cooled to room temperature, saturated potassium hydroxide solution (100 mL) was added over a 10-min period and the mixture refluxed again (105 °C, 18 h). The reaction was stopped and allowed to cool to room temperature. The 2,3,4,5-tetrabromothiophene 5 was extracted with dichloromethane, and dried over MgSO4, and solvent removed. The crude compound was attained as analytically pure colourless crystalline needles (39.6 g, 99.0 mmol, 78%); m.p. 114–115 °C (lit.22 116–118 °C); 13C NMR (100 MHz, CDCl3) δC 117.1, 110.4;
MS (EI): m/z 400 (M⁺), found 395.6467 C₄SBr₂ requires 395.6448 (⁷⁹Br). These properties were in accord with the literature.²²

4.2 General preparation of the diols (6), representative procedure, 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(1-ethanol) (6a)

To a solution of tetrabromothiophene 5 (1.10 g, 2.75 mmol) in dry THF (9 mL) under argon, nBuLi (3.77 mL, 1.5 M in hexane, 5.66 mmol) was added dropwise at -78 °C. Excess acetaldehyde (0.5 mL) was added at -78 °C. The temperature of the mixture was allowed to warm slowly during 2 h from (-78 to -25 °C). The reaction was quenched with water (8 mL), extracted with EtOAc, dried (MgSO₄) and evaporated to a brown crude product purified by flash column chromatography (7:3 pentane:EtOAc) to yield a colourless solid (0.696 g, 77%) as a mixture of diastereomers (1:1); Rf values 0.37, 0.44 (7:3 pentane:EtOAc); the m.p. for the mixture of diastereomers is 96–110 °C; ¹H NMR (400 MHz, acetone-d₆) δH 5.16–5.10 (m, 2H, CH₃(CH)), 4.89–4.88 (m, 2H, OH), 1.46–1.44 (m, 6H, CHCH₂); ¹³C NMR (100 MHz, acetone-d₆) δC 146.0, 107.9, 66.9, 24.8; IR (ATR) (cm⁻¹) v_max 3285, 2974, 2925, 1436, 1397, 1368, 1329, 1273, 1177, 1088, 1061, 983, 885, 861, 764; MS (ESI): found 329.8747, calcd. for C₈H₁₀Br₂O₂S 329.8748 (⁷⁹Br).

4.3 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(1-propanol) (6b)

Using tetrabromothiophene 5 (0.50 g, 1.25 mmol) in dry THF (3.2 mL) under argon, nBuLi (1.8 mL, 1.5 M in hexane, 2.75 mmol) was added dropwise at -78 °C. Then excess propanal (0.27 mL, 3.75 mmol) was added at -78 °C. The temperature of the mixture was warmed slowly during 3 h from (-78 to -65 °C). The reaction was quenched with water (5 mL) extracted with EtOAc, dried (MgSO₄), and evaporated to a brown crude product purified by flash column chromatography (8.5:1.5 light petroleum:EtOAc) yielding a yellow oil (0.215 g, 50%) as a mixture of diastereomers (2:1); Rf values 0.10, 0.07 (17:3 light petroleum:EtOAc); ¹H NMR (400 MHz, CDCl₃) δH 4.89 (m, 2H, CH), 1.73–1.65 (m, 4H, CH₂), 1.00 (t, J = 7.3 Hz, 6H), the OH signals were not observed due to exchange; ¹³C NMR (100 MHz, CDCl₃) δC 143.9, 108.7, 71.6, 32.0, 10.4; IR (ATR) (cm⁻¹) v_max 3313, 2964, 2930, 2874, 1458, 1378, 1319, 1319, 1171, 1089, 1041, 971, 868; MS (ESI): found 355.9092, calcd. for C₁₀H₁₀Br₂O₂S 355.9075.

4.4 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(3-methylbutanol) (6c)

Preparation from tetrabromothiophene 5 (2.00 g, 5.00 mmol, nBuLi (6.9 mL, 1.6 M in hexane, 11.0 mmol) and methylbutyraldehyde (1.29 g, 15.0 mmol). The brown crude product was purified by flash column chromatography (85:15 light petroleum:EtOAc) to yield a pale yellow solid as a (2:1) mixture of diastereomers (1.70 g, 82%); Rf values 0.31, 0.15 (85:15 light petroleum:EtOAc); m.p. 112–113 °C; ¹H NMR (400 MHz, CDCl₃) δH 5.14–5.13 (m, 2H, 2 × CHO), 2.22 (br, 2H, 2 × OH), 1.82–1.57 (m, 6H, 2 × CH₂, 2 × CH); 1.04–0.96 (m, 12H, 4 × CH₃); ¹³C NMR (100 MHz, CDCl₃) δC 143.1, 110.0, 68.8, 47.2, 24.9, 23.3, 22.1; IR (ATR) (cm⁻¹) v_max 3220, 2955, 2923, 2868, 1743, 1467, 1384, 1367, 1236, 1180, 1108, 1067, 846, 767, 679, 595; MS (ESI): found 413.9688, calcd. for C₁₄H₁₂Br₂O₂S 413.9687 (⁷⁹Br).

4.5 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(1-hexanol) (6d)

Preparation from tetrabromothiophene 5 (1.00 g, 2.50 mmol, nBuLi (3.7 mL, 1.5 M in hexane, 5.50 mmol) and n-hexanal (0.9 mL, ca. 0.75 g, 7.5 mmol). The brown crude product was purified by flash column chromatography (85:15 light petroleum:EtOAc) to yield of pale yellow solid as (1:1) mixture of diastereomers (0.80 g, 72%) as colourless solid; Rf 0.66, 0.37 (6:1 pentane:EtOAc); m.p. 82–84 °C; ¹H NMR (400 MHz, CDCl₃) δH 5.24 (s, 2H, 2 × OH), 4.93 (m, 2H, 2 × CH), 1.64–1.36 (m, 16H, 2 × CH₂CH₂CH₂CH₃), 0.92 (t, J = 7.3 Hz, 6H, 2 × CH₃); ¹³C NMR (100 MHz, CDCl₃) δC 144.2, 108.0, 70.1, 38.7, 31.5, 25.8, 22.8, 14.2; IR (ATR) (cm⁻¹) v_max 3296, 2954, 2921, 2851, 1642, 1464, 1367,
4.6 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(octan-1-ol) (6e)
Preparation from tetrabromothiophene 5 (3.00 g, 7.50 mmol, nBuLi (11.0 mL, 1.5 M in hexane, 16.51 mmol) and n-octan-1-ol (2.40 g, 18.76 mmol). The yellow crude product was purified by flash column chromatography (9:1 light petroleum:EtOAc) to yield a yellow oil as a (2:1) mixture of diastereomers (1.46 g, 40%); Rf values 0.30, 0.20 (9:1 light petroleum:EtOAc); 1H NMR (400 MHz, CDCl3) δH 5.06–5.02 (m, 2H, 2 × CH2), 1.83–1.77 (m, 4H, 2 × CH2), 1.31 (m, 20H, 2 × CH2CH2CH2CH2CH2CH2), 0.88 (t, J = 6.9 Hz, 6H, 2 × CH3), the OH signals ~δH2.4 were often not clearly observed due to exchange; 13C NMR (100 MHz, CDCl3) δC 142.8, 110.1, 70.6, 38.1, 31.9, 29.4, 29.3, 25.7, 22.8, 14.2; IR(ATR) (cm⁻¹) νmax 3331, 2954, 2922, 2853, 1463, 1315, 1168, 1050, 1019, 907, 765; MS (ESI): found 496.0619, calcd. for C30H43Br2O3S 496.0640.

4.7 General procedure for oxidation of compounds (6a-e) to corresponding ketone
Diols 6 (1.41 mmol) were dissolved in dichloromethane (20 mL), and activated MnO2 (10 molar equivalents) added. The dark black suspension was stirred (16 h) at 40–45 °C. Completion of the reaction was determined by TLC. After filtration through Celite, the reaction mixture was concentrated in vacuo to afford the corresponding ketone products as pale solids in about 90% yield. These products were >98% pure by 1H NMR spectroscopy and used without further purification.

4.8 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(ethan-1-ol) (7a)
Prepared from diol 6a (55 mg, 0.16 mmol) to obtain compound 7a as a colourless solid (47 mg, 87%). Rf/0.84 (7:3 pentane/EtOAc), m.p.168–170 °C [lit.17 173–174 °C]; 1H NMR (400 MHz, CDCl3) δH 2.74 (s, 6H, 2 × CH3); 13C NMR (100 MHz, CDCl3) δC 189.7, 142.7, 119.4, 29.9; MS (ESI): found 325.8431, calcd. for C13H23Br2O2S (7Br) 325.8435.

4.9 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(propan-1-ol) (7b)
Prepared from diol 6b (45 mg, 0.12 mmol) to obtain compound 8b as a colourless solid (35 mg, 0.10 mmol, 82%); Rf/0.70 (17:3 pentane/EtOAc), m.p.118–120 °C; 1H NMR (400 MHz, CDCl3) δH 3.10 (q, J = 7.1, 4H, 2 × CH2), 1.24 (t, J = 7.1, 6H, 2 × CH3); 13C NMR (100 MHz, CDCl3) δC 192.8, 141.9, 118.9, 35.5, 8.0; MS (ESI): found 351.8751, calcd. for C10H19Br2O2S (7Br) 351.8762.

4.10 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(3-methylbutan-1-one) (7c)
Prepared from diol 6c (0.50 g, 1.20 mmol) to obtain compound 7c as a colourless solid (0.44 g, 90%); Rf/0.90 (8:5:1.5 light petroleum:EtOAc); m.p. 97–99 °C; 1H NMR (400 MHz, CDCl3) δH 2.92 (d, J = 6.7 Hz, 4H, 2 × CH2), 2.30 (m, 2H, 2 × CH), 1.01 (d, J = 6.7 Hz, 12H, 4 × CH3); 13C NMR (400 MHz, CDCl3) δC 192.0, 141.9, 119.0, 50.5, 25.2, 22.7; IR(ATR) (cm⁻¹) νmax 2956, 2930, 2871, 1649, 1470, 1423, 1393, 1362, 1183, 1098, 1120, 1098, 984, 805, 767; MS (ESI): found 407.9384, calcd. for C16H18Br2O2S (7Br) 407.9388.

4.11 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(hexan-1-one) (7d)
Prepared from diol 6d (0.52 g, 1.18 mmol) to obtain compound 7d as a colourless solid (0.45 g, 87%); m.p. 71–72 °C; Rf/0.87 (8:1 light petroleum:EtOAc); 1H NMR (400 MHz, CDCl3) δH 3.05 (t, J = 7.3 Hz, 4H, 2 × CH2), 1.75 (m, 4H, 2 × CH2), 1.37 (m, 8H, 2 × CH2CH3), 0.91 (t, J = 7.3 Hz, 6H, 2 × CH3); 13C NMR (100 MHz, CDCl3) δC 192.5, 141.9, 118.9, 41.9, 31.4, 23.8, 22.6, 14.0; IR(ATR) (cm⁻¹) νmax 2950, 2918, 2867, 1666, 1461, 1426, 1396, 1370, 1246, 1173, 952, 870, 848, 72; MS (ESI): found 435.9707, calcd. for C16H18Br2O2S (7Br) 435.9700.
4.12 1,1’-(3,4-dibromothiophene-2,5-diyl)bis(ocyan-1-one) (7e)
Prepared from diol 6e (0.29 g, 0.58 mmol) to obtain compound 7e as a faint yellow solid (0.23 g, 0.465 mmol, 80%). Rf 0.74 (9:1 light petroleum:EtOAc); m.p. 48–50 °C; 1H NMR (500 MHz, CDCl3) δH 3.05 (t, J = 6.7 Hz, 4H, 2 × CH2), 1.76–1.71 (m, 4H, 2 × CH2), 1.38–1.25 (m, 16H, 2 × CH2CH2CH2CH2CH2CH2CH2CH2); 13C NMR (125 MHz, CDCl3) δC 192.6, 141.9, 119.0, 41.9, 31.8, 29.2, 29.2, 24.2, 22.7, 14.2; IR(ATR) (cm⁻¹) vmax 2954, 2916, 2847, 1666, 1559, 1470, 1269, 1222, 1171, 770, 727; MS (ESI): found 492.0300, calcd. for C20H10Br2O2S (79Br) 492.0300.

4.13 1,1’-(3,4-(ethylenedithio)thiophene-2,5-diyl)bis(3-methylbutan-1-one) (8a)
Neat 1,2-ethanediol (0.84 g, 9.01 mmol) was added slowly to a solution of 7e (1.68 g, 4.10 mmol) and Na2CO3 (1.00 g, 9.44 mmol) in dry DMF (20.5 mL) and the mixture was stirred at room temperature under an atmosphere of argon. After (64 h) the mixture was extracted with ethyl acetate (3 × 100 mL). The organic layer was washed with 2 M HCl (3 × 30 mL) and then dried with MgSO4, filtered and concentrated under reduced pressure. Purification was achieved by flash column chromatography (18:1 light petroleum:EtOAc) to afford 8a (0.991 g, 2.89 mmol, 70%) as yellow microcrystals; Rf 0.26 (18:1 light petroleum:EtOAc); m.p. 99–100 °C; 1H NMR (400 MHz, CDCl3) δH 3.21 (s, 4H, 2 × CH2), 2.69 (d, J = 6.7 Hz, 4H, 2 × CH2CO), 2.36–2.28 (m, 2H, 2 × CH), 1.00 (d, J = 6.7 Hz, 12H, 4 × CH3); 13C NMR (100 MHz, CDCl3) δC 192.9, 136.4, 133.5, 50.1, 26.5, 25.7, 22.8; IR(ATR) (cm⁻¹) vmax 2951, 2871, 1728, 1654, 1442, 1411, 1398, 1362, 1278, 1183, 1035, 956, 917, 880, 688; MS (EI): found 342.0785, calcd. for C16H22O2S:342.0782. Anal. Calcd. for C16H22O2S: C: 56.10; H: 6.47% found C: 55.97; H: 6.78%.

4.14 1,1’-(3,4-(ethylenedithio)thiophene-2,5-diyl) bis(hexan-1-one) (8b)
Neat 1,2-ethanediol (83.0 mg, 0.89 mmol) was added to a solution of 7d (156 mg, 0.36 mmol) and Na2CO3 (94 mg, 0.89 mmol) in dry DMF (1.8 mL) and the mixture was stirred at room temperature under an atmosphere of argon (40 h). The mixture was extracted with ethyl acetate (3 × 4 mL) and the organic layer was then washed with (2 M HCl) until DMF free. The organic extracts were dried with MgSO4 and concentrated in vacuo. The crude product was then purified by flash column chromatography (9:1 light petroleum:EtOAc) giving a pale yellow solid (75.0 mg, 57%); Rf 0.47 (9:1 light petroleum:EtOAc); m.p. 59–60 °C; 1H NMR (400 MHz, CDCl3) δH 3.22 (s, 4H, 2 × CH2), 2.28 (t, J = 7.2 Hz, 4H, 2 × CH2), 1.74–1.70 (m, 4H, 2 × CH2), 1.34–1.31 (m, 8H, 2 × CH2CH2); 0.91 (t, J = 7.2 Hz, 6H, 2 × CH3); 13C NMR (100 MHz, CDCl3) δC 193.3, 136.4, 133.2, 41.2, 31.5, 26.5, 24.3, 22.6, 14.1; IR(ATR) (cm⁻¹) vmax 2954, 2933, 2859, 1641, 1463, 1447, 1417, 1366, 1315, 1275, 1247, 1184, 1164, 973, 848, 730; MS (EI): m/z found 370.1095, calcd. for C16H22O3S: 370.1086.

4.15 1,1’-(3,4-(ethylenedithio)thiophene-2,5-diyl)bis(ocyan-1-one) (8c)
Neat 1,2-ethanediol (83 mg, 0.9 mmol) was added to a solution of 7e (194 mg, 0.39 mmol) and Na2CO3 (104 mg, 0.98 mmol) in dry DMF (4 mL) at room temperature. The mixture was then stirred for (40 h) until a precipitate formed. The mixture was extracted with ethyl acetate (4 × 10 mL) and the organic layer was then washed with (2 M HCl) until DMF free. The extracts were dried (MgSO4) and concentrated in vacuo. The crude product was purified by flash column chromatography (9:1 light petroleum:EtOAc) giving a butter cream yellow solid (75 mg, 45%); Rf 0.26 (9:1 light petroleum:EtOAc); m.p. 65–67 °C; 1H NMR (400 MHz, CDCl3) δH 3.20 (s, 4H, 2 × CH2), 2.20 (t, J = 7.4 Hz, 4H, 2 × CH2), 1.76–1.69 (m, 4H, 2 × CH2), 1.34–1.29 (m, 16H, 2 × CH2CH2CH2CH2); 0.86 (t, J = 7.4, 6H, 2 × CH3); 13C NMR (100 MHz, CDCl3) δC 193.2, 136.3, 133.1, 41.2, 31.8, 29.3, 29.1, 26.5, 24.5, 22.7, 14.2; IR(ATR) (cm⁻¹) vmax 2953, 2928, 2850, 1646, 1465, 1444, 1418, 1404, 1368, 1354, 1316, 1298, 1250, 1180, 1161, 1099, 1057, 1021, 970; MS (EI): found 426.1721, calcd. for C22H24Na2OS4 426.1721.

4.16 2,2’-Thiodiacetonitrile (12)
Solid Na2S·9H2O (10.8 g, 45.01 mmol) was dissolved in DME (35 mL), and chloroacetonitrile (4.77 g, 63.2 mmol) was then added. The mixture was allowed to stir at r.t. (16 h). Water was added and the compound was extracted from chloroform (3 × 40 mL). The organic layer was dried (MgSO4) and the
solvent removed. Elution through a silica plug (1:1 EtOAc:pentane) yielded compound 16 as a colorless oil (3.24 g, 28.9 mmol, 91%);\(^\text{1}\)H NMR (400 MHz, CDCl\(_3\)) \(\delta\) 3.57 (s, 4H); \(^{13}\)C NMR (100 MHz, CDCl\(_3\)) \(\delta\) 114.9, 17.5; IR (ATR) (cm\(^{-1}\)) \(v_{\text{max}}\) 2970, 2929, 2246, 1399, 1174, 922; MS (EI): found 112.0089, calcd. for C\(_4\)H\(_2\)N\(_2\)S requires 112.0089. The above values are concordant with literature data.\(^\text{22}\)

**4.17 Potassium 2,5-dicyanothiophene-3,4-bis(olate) (13)**

To dry tBuOK (8.0 g, 71.3 mmol) in dry THF (95 mL), a solution of 12 (4.00 g, 35.6 mmol) in THF (43 mL) was added dropwise at 0 °C. The mixture was stirred for 5 min and then added a solution of diethyl oxalate (5.21 g, 35.66 mmol) in dry THF (40 mL) at 0 °C. After 30 min stirring at 0 °C the precipitate was collected by vacuum filtration and washed with diethyl ether and THF to obtain 13 as a brown powder (7.26 g, 84%); \(^{13}\)C NMR (100 MHz, DMSO-\(d_6\)) \(\delta\) \(_C\) 174.9, 122.8, 65.7; IR (ATR) (cm\(^{-1}\)) \(v_{\text{max}}\) 2168, 1712, 1518, 1399, 1174, 922; MS (EI): found 191.9988, calcd. for C\(_8\)H\(_2\)N\(_2\)O\(_5\) requires 191.9988. The compound was used as obtained directly.

**4.18 3,4-Ethlenedioxythiophene-2,5-dicarbonitrile (14)**

Under an argon atmosphere potassium salt 13 (0.50 g, 2.06 mmol) was dissolved in anhydrous DMF (1.5 mL) at room temperature, and dry potassium carbonate (0.11 g, 0.83 mmol) added followed by tetrabutylammonium bromide (35 mg, 0.10 mmol). The mixture was heated to 135 °C and 1,2-dichloroethane (0.41 g, 4.13 mmol) added dropwise. After stirring at 135 °C (5 h) the reaction was stopped and allowed to cool down. The mixture was extracted with ethyl acetate (3 × 10 mL), washed with 5% w/w LiCl(aq) solution (3 × 10 mL) and the combined organic extracts dried (MgSO\(_4\)) and concentrated in vacuo. The crude product was purified by flash chromatography (1:1 EtOAc:hexane) \(^1\)H NMR (400 MHz, CDCl\(_3\)) \(\delta\) 4.42 (s, 4H, 2 × CH2); \(^{13}\)C NMR (100 MHz, CDCl\(_3\)) \(\delta\) \(_C\) 147.8, 110.6, 91.3, 65.2. IR (ATR) (cm\(^{-1}\)) \(v_{\text{max}}\) 2946, 2215, 1632, 1504, 1449, 1078, 914, 843, 806 cm\(^{-1}\). MS (EI): found 191.9988, calcd. for C\(_8\)H\(_2\)N\(_2\)O\(_5\)S191.9993.

**4.19 3,4-Ethlenedioxythiophene-2,5-dicarbalddehyde (15)**

A solution of DIBAL-H (1.08 mL, 1.2 M 20% wt. in toluene) was added dropwise at 0 °C to a solution of 14 (100 mg, 0.52 mmol) in dry toluene (5.2 mL). The reaction was stirred (30 min) at 0 °C until the starting material was consumed as judged by TLC analysis. The reaction mixture was quenched with (1 M, HCl) and extracted with ethyl acetate (3 × 10 mL) and dried (MgSO\(_4\)), the solvent was evaporated to yield the desired dialdehyde 15 (83 mg, 80%) as a tan brown solid. R/0.64 (EtOAc); \(^1\)H NMR (400 MHz, CDCl\(_3\)) \(\delta\) 10.04 (s, 2H, 2 × CHO); 4.45 (s, 4H, 2 × CH2); \(^{13}\)C NMR (100 MHz, CDCl\(_3\)) \(\delta\) \(_C\) 181.0, 147.4, 124.2, 65.0; IR (ATR) (cm\(^{-1}\)) \(v_{\text{max}}\) 2953, 2922, 2851, 1662, 1643, 1260, 1230; MS (EI): found 197.9987, calcd. for C\(_8\)H\(_2\)O\(_5\)S 197.9987. These values are consistent with published literature.\(^\text{11d}\)
